SUMMARY

Solana and Rust developer with about 8 years in software. The last 3 years I write production smart contracts on Solana with Rust, Anchor and the Solana SDK. Before that, my main stack was Node.js and React, and I'm open to backend Node.js roles. I connect on-chain programs to Node.js backends and web3 frontends, and I care a lot about secure code: Ed25519 signature checks, replay protection, and spotting scams and malicious code before they ship. I can take a project end to end: contracts, backend and frontend.

CORE SKILLS

Blockchain

Solana | Anchor | SPL Token | web3.js | DEX integrations | Compressed NFTs | Metaplex | Solidity (EVM)

Security

Ed25519 signature verification | Replay protection | Scam / malicious code review

Rust

Actix-Web | Diesel | Solana SDK

Backend

Node.js | Nest.js | Express.js | PostgreSQL | Redis | RabbitMQ

Frontend

React | Vue | TypeScript

EXPERIENCE

Written.app

Nov 2025 – Present

Solana Developer

- Built a compressed NFT (cNFT) system on Solana state compression: minting, storage and on-chain verification; tested it with a combination of Mollusk and LiteSVM.
- Designed it to keep costs low when minting NFTs at large scale.
- Wrote the Node.js backend that owns the whole web3 side of the project: on-chain calls, transaction handling and indexed chain data, which the main backend consumes for the rest of the product.

ToTheMoon
Apr 2025 – Nov 2025

Solana Developer

- Wrote the smart contracts for a token launchpad: fair launches, automated liquidity locking, whitelists, and migration to Raydium; tested them with LiteSVM for fast, lightweight test runs.
- Built a DEX integration SDK to trade across Raydium, Pump.fun, Moonshot, Orca and Jupiter from one interface.
- Built the onboarding frontend so teams could create and launch their tokens themselves.

BullPerks
Aug 2024 – Apr 2025

Solana Smart Contract Developer

- Wrote, tested and deployed Solana programs in Rust with the Solana SDK and Anchor; covered them with integration tests using solana-program-test.
- Added Ed25519 signature verification and replay protection to keep on-chain actions safe from forged or repeated transactions.
- Maintained the Node.js backend that bridges chain and server: wallet calls, transaction processing, and on-chain data sync.

frakt.xyz
May 2023 – Aug 2024

Node.js → Rust / Solana Developer

- Started on the Node.js backend, then moved to Rust and Solana work across the full Web3 stack (Anchor, web3.js, TypeScript).
- Built an on-chain betting game in Rust with reward distribution handled fully on-chain.

xfamily.io
Aug 2021 – Apr 2023

Node.js Backend Developer

- Built the APIs and database for a large crypto-swap portal.
- Used RabbitMQ for async jobs, Redis for cache, and Jest for tests; integrated with smart contracts.

Ownix.com
Mar 2020 – Aug 2021

Node.js Developer

- Built backend services for an NFT-sales startup, with real-time features over WebSocket and SSE.
- Worked with PostgreSQL, Redis, a microservice setup, and third-party integrations.

P2P.org
Aug 2019 – Mar 2020

Front-End Developer

- Built React and Vue interfaces with Redux and backend API integration. Moved into web3 development here.

Zensoft.io

Dec 2017 – Aug 2019

Front-End Developer → Team Lead

- Built SPAs, started Node.js backend work, and grew into a team lead role (planning, architecture, code reviews).

Svetofor.info

2017

Front-End Developer

- Turned designs into working website frontends: HTML/CSS markup plus JavaScript for the interactive parts. First dev job and the start of the whole path.
