SUMMARY

Full-stack developer with about 8 years in software, working with Node.js and React the whole way through. I build backend services REST APIs, PostgreSQL schemas, Redis caching, RabbitMQ queues, WebSocket and SSE realtime and the TypeScript/React frontends on top of them, so I can take a feature from database to UI without handing it off. Most of my work has been in fintech and crypto products, where correctness and security are not optional: I have shipped payment- and asset-handling systems, reviewed code for malicious behaviour before release, and spent the last three years writing Rust smart contracts alongside the JS stack. Comfortable owning a service end to end, and previously led a small frontend team.

CORE SKILLS

Backend

Node.js · Nest.js · Express.js · TypeScript · REST APIs · WebSocket / SSE · Microservices · Jest

Frontend

React · Redux · Vue · TypeScript · SPA architecture · HTML / CSS / SCSS

Data & Infra

PostgreSQL · Redis · RabbitMQ · Third-party integrations

Security

Ed25519 signature verification · Replay protection · Scam / malicious code review

Blockchain & Rust

Rust · Solana · Anchor · web3.js · Actix-Web · Diesel · Solidity (EVM)

EXPERIENCE

Written.app
Nov 2025 – Present

Node.js / Web3 Developer

- Built the Node.js service that owns the whole web3 side of the product and acts as a web3 facade for the main Ruby backend: it hides the chain behind a plain HTTP API, so the Ruby team ships features without touching Solana internals.
- The service stores all web3 data on its side (accounts, mints, on-chain state, transaction history) and prepares ready-to-send transactions that the main backend requests, signs off on and tracks to confirmation.
- Worked day to day with the Ruby developers: agreed the API contract between the two backends, handled retries, statuses and error semantics on the chain side, and kept the integration stable as the product changed.
- Connected it to the on-chain part built on Solana state compression (compressed NFTs): minting, storage and on-chain verification, designed to keep costs low at large mint volumes.

ToTheMoon
Apr 2025 – Nov 2025

Full-Stack / Solana Developer

- Built a TypeScript SDK that trades across Raydium, Pump.fun, Moonshot, Orca and Jupiter behind a single interface, so product teams stopped writing per-exchange integrations.
- Built the onboarding frontend end to end, letting teams create and launch their own tokens without developer help.
- Wrote the underlying smart contracts for the launchpad: fair launches, automated liquidity locking, whitelists and migration to Raydium.

BullPerks
Aug 2024 – Apr 2025

Node.js / Solana Developer

- Owned the Node.js backend bridging the product and the chain: wallet calls, transaction processing and on-chain data synchronisation.
- Hardened user-facing actions with Ed25519 signature verification and replay protection, blocking forged and repeated requests.
- Wrote, tested and deployed the Rust programs behind those flows, with integration test coverage.

---

frakt.xyz
May 2023 – Aug 2024

Node.js Developer → Full-Stack Web3

- Built the React client and worked on the BFF layer that fed it, integrating with the main backend.
- Wrote the backend for that client, with GraphQL as the API layer.
- Wrote tests for the Solana programs.

xfamily.io
Aug 2021 – Apr 2023

Node.js Backend Developer

- Designed and built the APIs and PostgreSQL database behind a large crypto-swap portal.
- Used RabbitMQ for async jobs and Redis for caching to keep the portal responsive under load; covered the service with Jest tests.
- Integrated the backend with smart contracts and external exchange services.

Ownix.com
Mar 2020 – Aug 2021

Node.js Developer

- Built backend services for an NFT auction startup, including realtime bidding over WebSocket and SSE.
- Worked in a microservice setup on PostgreSQL and Redis, with a number of third-party integrations.

P2P.org
Aug 2019 – Mar 2020

Front-End Developer

- Built React and Vue interfaces with Redux state management, wired to the backend APIs.
- First exposure to web3 products, which shaped the rest of my career.

Zensoft.io
Dec 2017 – Aug 2019

Front-End Developer → Team Lead

- Built single-page applications and picked up Node.js backend work alongside them.
- Grew into a team lead role: planning, architecture decisions and code reviews for a small frontend team.

Svetofor.info
2017

Front-End Developer

- Turned designs into working website frontends: HTML/CSS markup plus JavaScript for the interactive parts. First dev job and the start of the whole path.
